

(a) Rotary mechanism and one blow

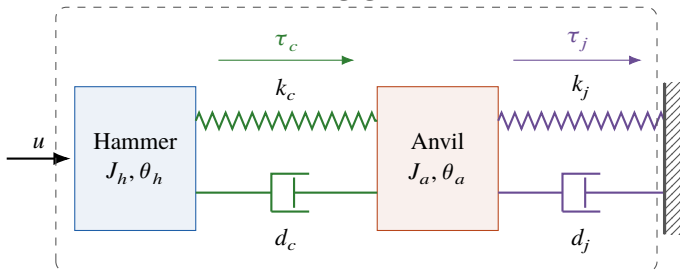

Contact end view: angular clearance
between engagement faces

Output path shown schematically; effective joint twist and loss
belong to (k_j, d_j) , rigid co-rotating output inertia to J_a .

Incoming $\rightarrow$ engagement $\rightarrow$ compression $\rightarrow$ rebound $\rightarrow$ separation $\rightarrow$ preparation

(b) Active-contact model: engagement to release

Reactive boundary: two inertias and two effective springs

Separate damper heat leaves; a moving fixture adds a work port.
